

Abdullah Omer Ahmed (Sr. Business Intelligence Developer)

eng.abdullahomar@outlook.com | (966) 541841198 | Riyadh, KSA  

ABOUT

Senior Business Intelligence Developer with 10+ years in software and data, the last 5 dedicated to building cloud analytics platforms end to end. Currently own the BI layer at Saudi Arabia's National Center for Non-profit Sector, where I consolidated four national platforms from on-premise MS SQL Server into a governed Google BigQuery data warehouse and rebuilt executive reporting on top of it in Power BI and Metabase. Strong across the full BI stack — ELT pipeline design, dimensional modeling, SQL/DAX performance and cost tuning, and governed KPI definitions — with a track record of turning ambiguous business questions into dashboards that leadership actually makes decisions with.

CORE COMPETENCIES

Google BigQuery

Cloud Data Warehousing

ELT / ETL Pipeline Design

SQL Server → BigQuery Migration

Power BI & DAX

Metabase Self-Service BI

Dimensional Data Modeling

Semantic Layer & Governance

Executive Dashboards & KPIs

Query Cost & Performance Tuning

Data Quality & Reconciliation

Stakeholder Management

WORK EXPERIENCE

Sr. Business Intelligence Developer

National Center for Non-profit Sector | المركز الوطني لتنمية القطاع غير الربحي Riyadh, KSA | Aug 2023 - Present

Responsibilities:

- Own the enterprise BI and analytics layer for the Center's national platforms — UVP, Establishment, Donation and IDM — end to end, from source-system extraction through to the dashboards used by executives and sector regulators.
- Architect and maintain the Google BigQuery data warehouse on GCP: project and dataset design, partitioned and clustered tables, star-schema marts, plus naming, access and IAM standards applied consistently across every platform.
- Design and operate the ELT pipelines that replicate data from on-premise MS SQL Server into BigQuery, using incremental watermark loads, automated scheduling, and row-count reconciliation against source systems.
- Build the Power BI semantic models and reports served from BigQuery — DAX measures, role-level security, incremental refresh — and curate Metabase models so business teams can self-serve without writing SQL.
- Partner with platform owners, product managers and leadership to translate ambiguous business questions into agreed metric definitions, then publish them as a single governed KPI catalogue used across the Center.
- Tune warehouse design and SQL for both speed and spend: partition pruning, clustering, materialized views and scheduled aggregates that keep interactive dashboards fast and query cost predictable.

Achievements:

- Led the migration of four core non-profit sector platforms (UVP, Establishment, Donation, IDM) from siloed on-premise SQL Server databases into a unified BigQuery warehouse, enabling cross-platform reporting for the first time in the organization.
- Cut report and dashboard processing times by ~50% by moving BI workloads off operational databases onto partitioned, pre-aggregated BigQuery marts — removing query load from production systems in the process.

- Rolled out Power BI and Metabase on top of the BigQuery layer, expanding self-service analytics to non-technical business users and sharply reducing the volume of ad-hoc report requests reaching the data team.
- Introduced automated data quality and source-to-warehouse reconciliation checks, lifting reporting accuracy and consistency across business units by ~20% and surfacing pipeline failures before stakeholders saw them.
- Standardized KPI definitions across departments, giving leadership a single trusted set of numbers for volunteering, donation and establishment performance.
- **Tech Stack:** Google BigQuery, GCP, MS SQL Server, T-SQL, ELT Pipelines, Power BI (DAX / Power Query), Metabase, Dimensional Data Modeling

Business Intelligence Developer

Developers & Designers | مطورون ومصممون

Riyadh, KSA | Dec 2021 - Aug 2023

- Delivered end-to-end BI solutions for enterprise clients: gathered requirements from business leaders, modeled the data, and shipped interactive Power BI and Tableau dashboards that replaced manual Excel reporting cycles.
- Built and optimized SQL data models and reporting views over MS SQL Server, applying indexing, query rewriting and pre-aggregation to bring slow executive reports down from minutes to seconds.
- Designed dimensional star-schema models and reusable semantic layers, so multiple report suites could be built on one consistent, governed definition of each metric.
- Automated recurring data preparation and reporting tasks with SQL and Python, eliminating hours of manual work per reporting cycle and removing a recurring source of human error.
- Led BI tool selection and rollout for client teams, including data governance and security practices, user training and adoption support that turned one-off deliverables into daily-use platforms.
- Managed BI projects from scoping through delivery — timelines, priorities and stakeholder communication — consistently delivering on schedule and to client expectations.
- **Tech Stack:** SQL, MS SQL Server, Power BI, Tableau, Python, Advanced Excel, Data Modeling

Web & Database Developer

Hsoub | صوب

Riyadh, KSA | Mar 2016 - Dec 2021

- Designed and shipped data-driven web applications for business clients, owning the full stack from MySQL schema design through to the front-end interface.
- Modeled relational databases and wrote the SQL behind client-facing reporting screens — sales, traffic and operational summaries that gave business owners their first real visibility into performance.
- Integrated third-party APIs and payment/analytics services, consolidating data from multiple external systems into a single application database.
- Optimized slow queries and application performance through indexing, caching and query restructuring, cutting page load times on data-heavy pages.
- Built custom PHP and WordPress solutions — themes, plugins and admin tooling — tailored to each client's operational workflow.
- Worked directly with clients to translate business requirements into technical specifications and delivered against them independently.
- **Tech Stack:** PHP, MySQL, SQL, JavaScript, HTML/CSS, Bootstrap, WordPress, REST APIs

Junior Web Developer

Sudan Digital Solutions

Khartoum, Sudan | Jan 2016 - Aug 2016

- Developed landing pages and internal tools for startup clients using HTML, CSS and JavaScript, delivering features alongside the senior development team.
- Wrote SQL queries against client databases to support internal reporting and troubleshooting requests.

- Worked in an agile delivery environment — sprint planning, stand-ups and Git-based collaboration across the development team.
- **Tech Stack:** HTML, CSS, JavaScript, SQL, Git

EDUCATION

Sudan University Of Science and Technology

B.S. Software Engineering

Khartoum, Sudan | Feb, 2020

TECHNICAL SKILLS

- **Cloud & Data Warehousing:** Google Cloud Platform (BigQuery, Cloud Storage, BigQuery Data Transfer Service, IAM), partitioning & clustering, materialized views, query cost optimization
- **BI & Visualization:** Power BI (DAX, Power Query / M, Row-Level Security, Incremental Refresh), Metabase, Tableau, Looker Studio, Advanced Excel
- **Databases & SQL:** MS SQL Server (T-SQL), BigQuery SQL, PostgreSQL, MySQL — query tuning, indexing, stored procedures, window functions
- **Data Engineering:** ELT / ETL design, incremental & watermark loading, on-premise to cloud migration, dimensional & star-schema modeling, data reconciliation, job scheduling
- **Programming:** SQL, Python (pandas), DAX, Git, PHP, HTML/CSS
- **Governance & Delivery:** KPI definition & metric governance, data quality frameworks, access control, requirements gathering, stakeholder presentation
- **Soft Skills:** Problem Solving, Critical Thinking, Communication, Attention to Detail, Collaboration, Adaptability, Time Management
